

Order Flow Presentation v2 Trader Manual

1. Overview

Dear Trader,

Traditional Order Flow analysis usually depends on **Tick Replay** to review past buy and sell orders in detail. However, this approach demands heavy system resources, which can overload your setup and result in an unstable trading experience.

Moreover, Order Flow is **inherently complex**, with vast amounts of Buy, Sell, and Delta data. This can make it challenging for traders to focus on the most relevant information and may introduce noise that complicates decision-making.

With **No Tick-Replay** technology, Order Flow Presentation v2 achieves high accuracy while ensuring smooth performance and a more seamless trading experience. The system has also been redesigned to **filter, organize, and prioritize information**, allowing you to read Order Flow more quickly, clearly, and apply it more effectively in real trading.

Figure 1

Order Flow Presentation v2 works without the need for Tick Replay.

2. Order Flow Presentation Styles

2.1. Presentation modes

Order Flow is organized and displayed on the chart through 3 styles: **Bar Presentation**, **Today Presentation**, and **Delta Chart**.

Figure 2

2.1.1 Bar Presentation

Bar Presentation focuses on Order Flow data **within each candle**, allowing you to observe and compare Buy/Sell activity at each price level as the candle forms.

Key information includes **Buy/Sell Volume**, **Delta Volume**, **Delta at each price level**, **total volume per price level**, the candle's **POC**, and highlighted points displayed as small dots.

- Buy/Sell Volume

Figure 3

- Delta Volume

Figure 4

- Volume Delta at each price level

Figure 5

- Total Volume at each price level

Figure 6

- POC

- The POC is highlighted in green when Buyers dominate at a price level.

- The POC is highlighted in orange when Sellers dominate at a price level.

- **Average Volume Thresholds for each candle:** The 2 thin vertical lines on each candle represent the Average Volume Thresholds, which serve as reference levels to determine whether Buy/Sell activity at each price within the candle is strong.

- **Highlight Dots:** Indicate which side is dominant at a given price.
 - Green dots show that Buy Volume exceeds the average Buy threshold
 - Orange dots show that Sell Volume exceeds the average Sell threshold.

2.1.2 Today Presentation

Today Presentation displays Order Flow information at a daily/session scale, allowing you to see the "big picture" of Volume and Delta distribution across prices throughout the trading day.

The key difference from Bar Presentation is that Today Presentation shows data at the Day/Session level, along with additional attributes such as **significant levels from the previous day** and highlighted levels that stand out.

- **yHigh:** The highest price of the previous day/session (y stands for "yesterday").
- **yClose:** The closing price of the previous day/session.
- **yLow:** The lowest price of the previous day/session.
- **yPOC:** The POC of the previous day/session.
- **POC:** The POC of the current day/session.
- **Strong Buying/Selling levels:** Levels showing Volume information at prices that exceed the daily/session Average Volume threshold, with colors indicating the dominant side at each price.

2.1.3 Delta chart

The **Delta Chart** is displayed below the Price Chart and shows the **OHLC Delta** information for the corresponding candle above. Specifically:

- **Open Delta:** Always starts at the Zero line, representing the beginning of the candle.
- **High Delta:** The highest Delta value recorded during the formation of the candle.
- **Low Delta:** The lowest Delta value recorded during the formation of the candle.
- **Close Delta:** The Delta value recorded at the candle's close.

Delta Candles resemble traditional candlesticks in shape, but they actually represent the trajectory of Delta movement within a single candle.

- **Positive Delta:** when Close Delta > Open Delta
- **Negative Delta:** when Close Delta < Open Delta

2.2. Colors & Information Priority

2.2.1 Buy and Sell Colors

The indicator uses a consistent color scheme to distinguish between the two trading sides:

- **Buy side:** displayed on the right side of the candle, using **light/dark purple** to represent aggressive volume executed at the Ask price (Buy Volume).
- **Sell side:** displayed on the left side of the candle, using **yellow/orange** to represent aggressive volume executed at the Bid price (Sell Volume).
- **Balanced volume:** if Buy and Sell volumes are equal, the indicator displays gray.

This color convention is applied consistently across Bar Presentation, Today Presentation, and all other Presentation Styles.

Maintaining a consistent layout and color scheme helps you **quickly identify the dominant side** without needing to read each individual number.

2.2.2. Highlight Colors

Highlight colors are used to emphasize price levels where trading activity is more significant compared to the rest of the data.

- **Yellow highlight:** indicates that Sellers are dominant at that level, but not significantly stronger than Buyers.

- **Dark orange highlight:** indicates that Sellers are dominant at that level and significantly stronger than Buyers.

Figure 14

The sell side is dominant and significantly stronger than the buy side

- **Light purple highlight:** indicates that Buyers are dominant at that level, but not significantly stronger than Sellers.

Figure 15

Buyer are in control, but the advantage is not significant

- **Dark purple highlight:** indicates that Buyers are dominant at that level and significantly stronger than Sellers.

Figure 16

The buy side is dominant and significantly stronger than the sell side

- **Gray highlight:** indicates that Buyers and Sellers are balanced in volume.

Figure 17

Buying and selling pressure is currently balanced

2.3. Presentation Style

Order Flow Presentation v2 offers multiple Presentation Styles to display the same Order Flow dataset from different visual perspectives.

Changing the Style does not alter the underlying data. It only adjusts how the data is organized and prioritized, allowing you to choose the view that best suits their analysis needs.

Order Flow Presentation v2 provides 5 display modes:

2.3.1 Table Style

Table Style displays Order Flow data in a tabular format, with Buy Volume, Sell Volume, and Delta clearly presented at each price level.

- Ideal for reading detailed numerical data
- Allows direct comparison of Buy, Sell, and Delta
- Suitable for traders familiar with traditional Order Flow analysis

Table Style provides the highest level of detail, but requires traders to actively filter and focus on the most relevant information.

Figure 19

In Table Style, each column within a candle represents the Buy/Sell volume for that specific candle. The left column shows Sell Volume, while the right column shows Buy Volume.

2.3.2 Text Style

Figure 20

Text Style is a simplified version of Table Style, focusing on displaying **core information** with a minimal layout.

- Suitable for quick observation in volatile market conditions
- Reduces visual clutter compared to Table Style
- Ideal for intraday trading

Text Style prioritizes readability and rapid recognition over absolute detail.

Figure 21

2.3.3 Profile Divided

Figure 22

Profile Divided Style displays Order Flow in a profile format, **separating Buy Volume and Sell Volume** at each price level.

- Allows direct comparison of Buy and Sell strength at the same price
- Makes it easier to identify price levels with significant imbalance
- Suitable for analyzing price reactions at support/resistance zones

This style emphasizes the 2-sided structure of Order Flow.

Figure 23

2.3.4 Profile Combined

Figure 24

Profile Combined Style merges Buy and Sell Volume at each price level into a single profile, while highlighting the **dominant side**.

- Focuses on **total volume and the dominance of one side**
- Reduces complexity when detailed side-by-side comparison is not needed
- Suitable for identifying price levels with concentrated trading activity

This style helps you quickly spot Order Flow "**hot zones**" on the chart.

Figure 25

Average Volume

2.3.5 Profile Delta

Figure 26

Negative Delta

Positive Delta

Profile Delta Style displays **Delta at each price level**, showing the imbalance between Buy and Sell activity.

- Suitable for focusing on Buy/Sell imbalances
- Makes it easier to spot prominent positive or negative Delta zones
- Useful for identifying hidden buying or selling pressure behind price movements

Profile Delta Style removes the total volume element, focusing entirely on the **direction and intensity** of Delta.

Note:

- Each Presentation Style serves a different analytical purpose. The choice of Style should depend on market context and the information you want to prioritize, rather than trying to use all styles simultaneously.
- All 5 Styles are available for both Bar Presentation and Today Presentation. Bar Presentation helps you analyze Order Flow behavior **within individual candles**, while Today Presentation provides an **overview of the entire session**, showing how Volume and Delta are distributed across prices throughout the trading day.

3. General

General	
Volume Base	BidAskPrice_RealVolume
Presentation Style: Bar	Table
Presentation Style: Today	ProfileCombined
Threshold: Strong Volume	50
Threshold: Strong Delta Percentage	25
Peak Neighborhood (Bars)	4
Row Threshold: Multiplier Bar	2
Row Threshold: Multiplier Today	2
Delta Avg: Period	20
Delta Threshold: Multiplier	2
Day Start: Definition	SessionBreak
Day Start: Custom Time	93000
On State: Hide Bars	☐
Off State: Hide Bars	☐
Off State: Keep Today	☒
Off State: POC Series	☒

3.1. Volume Base

- **BidAskPrice_RealVolume**

This mode should be used for instruments with real Volumes (**futures & stocks**).

Buy Volume & Sell Volume are defined as follows:

- **Buy Volume:** If the price of a tick is greater than or equal to the ask price, the real Volume of the tick is categorized as Buy Volume and added to the total Buy Volume of the bar that the tick belongs to.
- **Sell Volume:** If the price of a tick is less than or equal to the bid price, the real Volume of the tick is categorized as Sell Volume and added to the total Sell Volume of the bar that the tick belongs to.

In this mode, if Tick Replay is enabled, the indicator functions on both **historical & real-time data**. Please visit https://ninjatrade.com/support/helpGuides/nt8/en-us/?tick_replay.htm for instructions on how to enable Tick Replay.

If Tick Replay is disabled, the indicator functions only on **real-time data** and there are no calculations on historical data. Any actions that lead to chart reloading will erase all calculations.

- **UpDownTick_RealVolume**

This mode should be used for instruments with real Volumes (**futures & stocks**).

Buy Volume & Sell Volume are defined as follows:

- **Buy Volume:** If a tick is up or remains up, the real Volume of the tick is categorized as Buy Volume and added to the total Buy Volume of the bar that the tick belongs to.
- **Sell Volume:** If a tick is down or remains down, the real Volume of the tick is categorized as Sell Volume and added to the total Sell Volume of the bar that the tick belongs to.

In this mode, the indicator functions on both **historical & real-time data**. However, please be advised that historical and real-time calculations of the same bar may not be 100% identical, due to technical limitations.

- **UpDownTick_UnitVolume**

This mode is the one & only choice for instruments without real Volumes (**forex, CFDs, indices**).

Buy Volume & Sell Volume are defined as follows:

- **Buy Volume:** If a tick is up or remains up, a unit Volume (1) is credited as Buy Volume for the tick and added to the total Buy Volume of the bar that the tick belongs to.
- **Sell Volume:** If a tick is down or remains down, a unit Volume (1) is credited as Sell Volume for the tick and added to the total Sell Volume of the bar that the tick belongs to.

In this mode, the indicator functions on both **historical & real-time data**. However, please be advised that historical and real-time calculations of the same bar may not be 100% identical, due to technical limitations.

3.2. Presentation Style

"Presentation Style: Bar" & "Presentation Style: Today": These settings allow you to choose the display Style for Order Flow information, including Table, Text, Profile Divided, Profile Combined, and Profile Delta, as described in Section 2.3.

The screenshot shows the 'General' settings panel. The 'Presentation Style: Bar' option is highlighted with a white border. To its right, a dropdown menu is open, showing a list of options: BidAskPrice_RealVolume, ProfileDelta, Table, Text, ProfileDivided, ProfileCombined, and ProfileDelta (highlighted in blue).

The screenshot shows the 'General' settings panel. The 'Presentation Style: Today' option is highlighted with a white border. To its right, a dropdown menu is open, showing a list of options: BidAskPrice_RealVolume, ProfileDelta, ProfileDivided (highlighted in blue), Table, Text, ProfileDivided, ProfileCombined, and ProfileDelta.

3.3. Threshold

The screenshot shows the 'Threshold' settings panel. It contains two rows: 'Threshold: Strong Volume' with a value of 100, and 'Threshold: Strong Delta Percentage' with a value of 25.

- **"Threshold: Strong Volume":** This setting defines the level considered as Strong Volume. Any volume below this value is regarded as weak or insignificant.

- **"Threshold: Strong Delta Percentage"**: This setting defines the percentage difference between Buy Volume and Sell Volume required for Delta to be considered strong. If the Delta difference of the dominant side does not exceed this threshold, the Delta is regarded as weak or insignificant.

The indicator **highlights the Volume or Delta of the dominant side** in a stronger color when both of the following conditions are met:

- Volume $\geq$ Threshold: Strong Volume
- Delta difference $\geq$ Threshold: Strong Delta Percentage

The higher the threshold values, the more reliable the highlights, but they appear less frequently.

The lower the threshold values, the more highlights appear, but they may include more noise.

This parameter applies to both **Presentation Style: Bar** & **Presentation Style: Today**

Example (Figure 28):

If **Threshold: Strong Volume = 50** and **Threshold: Strong Delta Percentage = 25**, the indicator will highlight the Volume or Delta of the dominant side when the Buy Volume, Sell Volume, or Total Volume (depending on the selected display mode) exceeds 50, and the Delta difference between Buy and Sell Volume exceeds 25%.

Example (Figure 29):

If **Threshold: Strong Volume = 5** and **Threshold: Strong Delta Percentage = 25**, the indicator will highlight the Volume or Delta of the dominant side when the Buy Volume, Sell Volume, or Total Volume (depending on the selected display mode) exceeds 5, and the Delta difference between Buy and Sell Volume exceeds 25%.

3.4. Row Threshold

Row Threshold: Multiplier Bar	2
Row Threshold: Multiplier Today	1

- **"Row Threshold: Multiplier Bar"**: This is a multiplier used to calculate the average Volume or Delta threshold for each candle by multiplying this factor with the average Volume or Delta to generate the **Volume Average Threshold**.
 - For **Table, Text, Profile Divided, and Profile Delta Styles**, the indicator highlights price levels where Buy Volume, Sell Volume, or Delta exceeds the candle's average, using dots colored according to the side exceeding the threshold.
 - For **Combined Style**, the indicator highlights price levels where the Total Volume exceeds the candle's average threshold, using dots colored according to the dominant side.

Example (Figure 30):

If the average Volume of a candle = 5 and **Row Threshold: Multiplier Bar = 3**, the candle's Volume Average Threshold is calculated as $5 \times 3 = 15$. When the Buy Volume at a price level ≥ 15 , the indicator will display a green dot at that level.

The higher the Multiplier value, the more reliable the highlights, but they appear less frequently.

The lower the Multiplier value, the more highlights appear, but they may include more noise.

- **"Row Threshold: Multiplier Today":** This is a multiplier used to calculate the average Volume or Delta threshold for the **current trading day**. Multiplying this factor with the average Volume or Delta generates the Volume Average Threshold.

Figure 31

Any bar that exceeds the user-defined average volume threshold for the current trading day will be highlighted

When a price level's Volume or Delta exceeds this threshold, the indicator will display a level colored according to the dominant side at that price:

- **Buy Volume > Sell Volume:** the indicator shows a green level
- **Buy Volume < Sell Volume:** the indicator shows a dark orange level
- **Buy Volume = Sell Volume:** the indicator shows a gray level

Figure 32

The level thickness is increased by 1.5×

Both Buy and Sell Volume exceed the average volume thresholds for the current trading day

In **Table**, **Text**, **Profile Divided**, and **Profile Delta Styles**, if both Buy Volume and Sell Volume exceed the average threshold, the level will be displayed 1.5 times thicker than normal.

Figure 33

Example (Figure 33):

- If the average Volume for the current day = 75 and **Row Threshold: Multiplier Today = 3**, the average Volume threshold will be $75 \times 3 = 225$.
- When the Volume at a price level ≥ 225 , the indicator will display the corresponding levels.

The higher the Multiplier value, the more reliable the levels, but they appear less frequently. The lower the Multiplier value, the more levels appear, but they may include more noise.

3.5. Peak Neighborhood(Bar)

Peak Neighborhood (Bars)

4

"Peak Neighborhood (Bar)": This setting adjusts the density of levels displayed in **Today Presentation**.

It acts as a filter, removing levels at price points where Volume and Delta are not strong enough. Only levels at price points with the most prominent Volume and Delta within each price region are displayed.

The higher the Peak Neighborhood value, the more reliable the levels, but they appear less frequently.

The lower the Peak Neighborhood value, the more levels appear, but they may include more noise

Example (Figure 34):

If **Peak Neighborhood (Bar) = 10**, this means the indicator will retain levels with the highest Volume or Delta compared to the 10 price levels above and 10 price levels below, while also exceeding the average threshold for the current trading day.

3.6. Delta

3.6.1 Delta Avg: Period

- **"Delta Avg: Period"**: This setting defines the period (number of candles) used to calculate the average Delta for displaying the Delta Chart. The Delta average is calculated separately for each side.
 - **Threshold Positive**: the average threshold for positive Delta
 - **Threshold Negative**: the average threshold for negative Delta

Example (Figure 36):

When Delta Avg: Period = 10:

- **Threshold Positive** is calculated based on the 10 most recent candles with positive Delta.
- **Threshold Negative** is calculated based on the 10 most recent candles with negative Delta.

3.6.2 Delta Threshold: Multiplier

- **"Delta Threshold: Multiplier"**: This is a multiplier used to calculate Threshold Positive and Threshold Negative by multiplying this factor with the average positive or negative Delta.

Example (Figure 37):

When **Delta Threshold: Multiplier = 10**, this means:

- Threshold Positive = Average Positive Delta × 10
- Threshold Negative = Average Negative Delta × 10

3.7. Special control parameters

3.7.1. Day Start

Day Start: Definition	SessionBreak CustomTime
-----------------------	---

- **"Day Start: Definition"**: This parameter allows you to choose how the start of the day is defined for calculating and generating the **Today Presentation**. You can customize it with 2 modes: **Session Break & Custom Time**.
 - **Session Break**: The indicator calculates and generates Today Presentation based on the trading session.
 - **Custom Time**: The indicator calculates and generates Today Presentation according to a user-defined start time.

Day Start: Custom Time	93000
------------------------	-------

- **"Day Start: Custom Time"**: This setting allows you to define the start time for calculating and generating the **Today Presentation** according to your preference. This setting can only be applied when the **Custom Time mode** is selected.

Example (Figure 38):

When this setting is set to **100000**, it means the indicator will calculate and generate the **Today Presentation** at **10:00:00**.

3.7.2. On/Off State – Display Behavior

The **On/Off State** allows you to control the visibility of price (candles) and Order Flow, optimizing the observation experience for different analytical contexts.

- **On State:** When the indicator is in the On State, Order Flow Presentation v2 operates fully according to the configured settings.
 - **Hide Bars: Disabled:** The chart displays both **price structure (candles) & Order Flow data simultaneously**, suitable when you need to observe the relationship between price behavior and order flow.

- **Hide Bars: Enabled:** All price candles are hidden, leaving **only the Order Flow data on the chart**. This mode allows you to focus entirely on the flow of money, reducing distraction from candle shapes and traditional price structure.

Note: Enabling or disabling **On State: Hide Bars** does not affect the candles in the Delta Chart.

- **Off State:** When the indicator is switched to **Off State**, the candle-based Order Flow displays are turned off, allowing you to view the price chart more simply.
 - **Hide Bar & Keep Today: Disabled:** Both **Bar Presentation** and **Today Presentation** are hidden; the chart only shows price and other indicators.
 - **Hide Bar & Keep Today: Enabled:** **Bar Presentation** is hidden, while **Today Presentation** remains on the chart. This mode allows you to retain the daily Order Flow context without cluttering the price chart during analysis or trading.

Note:

- The **On/Off State** only affects the display and does not alter the Order Flow data or the indicator's calculation logic.
- Switching between states can be used flexibly to either read detailed Order Flow or keep the chart clean, depending on your analytical needs.

3.7.3. POC plot

The Daily POC line represents the price level with the highest trading volume during the day.

It helps you quickly identify the price level where the market traded the most during the session.

- **Step 1:** In the Order Flow Presentation v2 interface, scroll down and select "**POC Day**".
- **Step 2:** In "POC Day", select the "**Color**" option.
- **Step 3:** Choose **any color** in the "Color" option and then click "**OK**".
